

AIRBNB Case Study IIIT-B

METHODOLOGY DOCUMENT PPT 1:

IN THE CASE STUDY WE HAVE USED JUPITER NOTEBOOK TO PERFORM INITIAL ANALYSIS OF THE DATA AND TABLEAU FOR DATA ANALYSIS AND VISUALIZATION.

INITIAL ANALYSIS USING JUPITER NOTEBOOK: DATA SET USED: AB_NYC_2019.CSV

NUMBER OF ROWS: 48895

NUMBER OF COLUMNS: 16

By Pabitra Kumar Pradhan Ujwal Kesharwani Vedha Priya Kumaresan

Step 2: Data Wrangling:

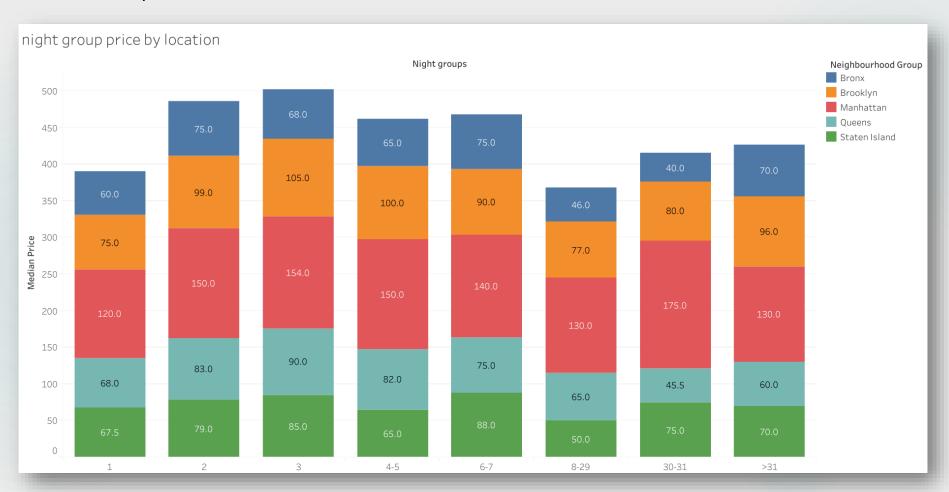

- Checked the Duplicate rows in our dataset and no duplicate data was found.
- Checked the Null Values in our dataset. Columns like name, host-name, last review and review-per-month have null values.
- We've dropped the column name as missing values are less and dropping it won't have significant impact on analysis.
- Checked the formatting in our dataset. Identified and review outliers.

Data Analysis and Visualizations using Tableau:

 We have used tableau to visualize the data for the assignment. Below are the detailed steps used for each visualization.

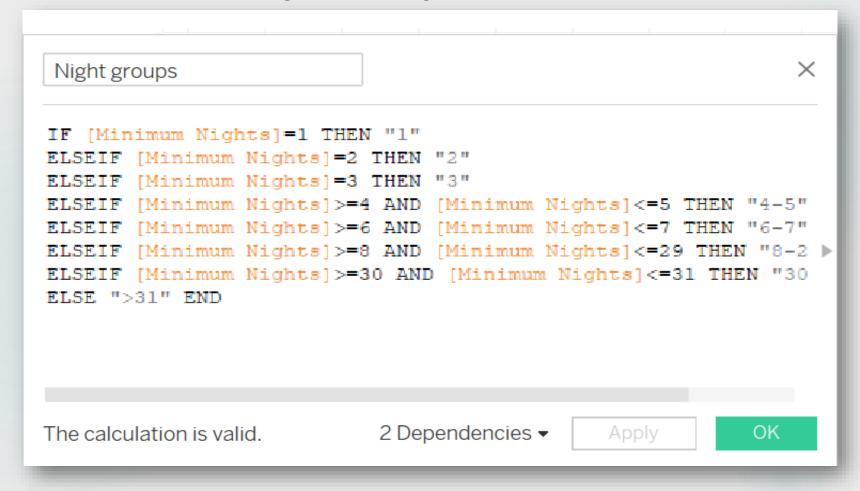

1. Booking Price with respect to minimum nights.

- We create a bar chart to understanding Booking Price with respect to minimum nights.
- We added Location to the colors Marks card to highlight the different Location in different colors and count of Host Id and median price to the size.

2. Customer Booking w r t minimum nights:

- We created the bin for Minimum nights as shown below.
- The bins were used to display the distribution of minimum nights based on the number of ids booked for each neighborhood group.

3. Reviews by Location And Room type

- We create a two bar chart for Reviews by location and room type.
- We add a room type in color.
- We add count of number of reviews and avg. number of reviews in row side.
- We add Neighborhood group in columns.

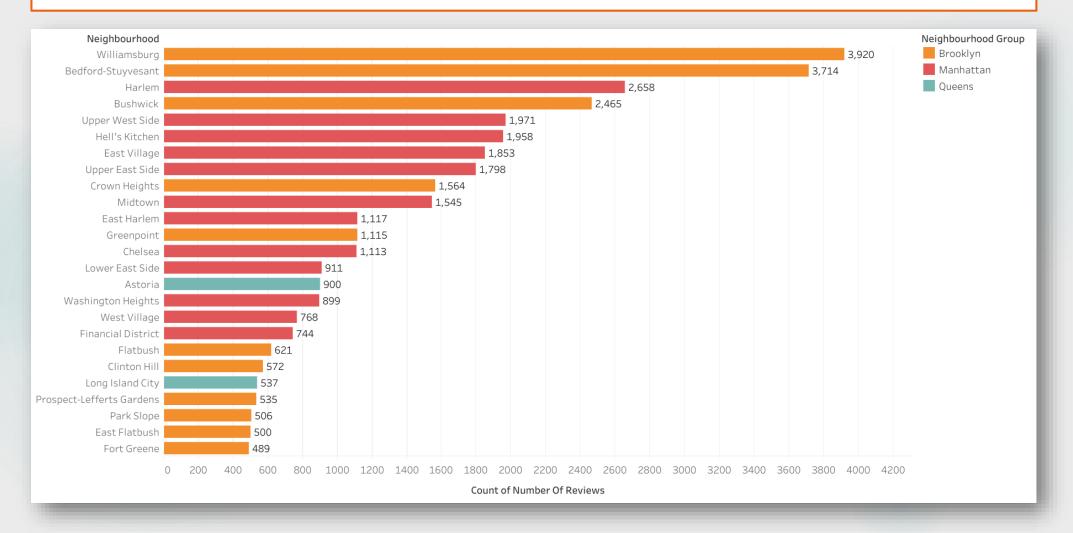

4. Reviews Room and Minimum Night

- We create a Heat Map for Reviews, room type, Minimum nights and Neighborhood group.
- We add Number of reviews in colors and Label.
- We add Neighborhood group columns.
- We add Room type and Night group in rows.

5. Top 25 Neighborhood

- We create a horizontal bars for top 25 Neighborhood.
- We add a neighborhood in colors and row.
- We add a count of Number of Reviews in Labels and Columns.

6. Price variation with respect to Geography

- We create a Map for Price variation with respect to Geography.
- We add a Neighborhood in Detail,
 Label and Colors.
- We add a avg. of Price in Size.
- We add a Latitude and Longitude.

Methodology Document PPT 2:

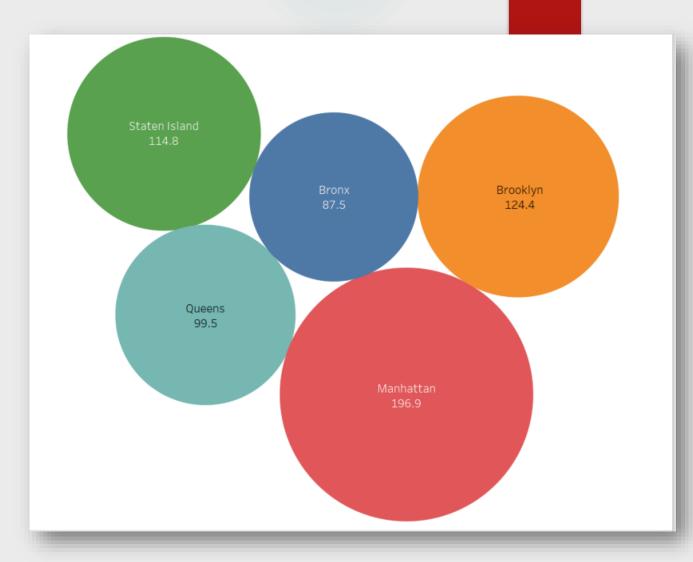

1. Top 10 Host

- We created tree map for top 10 host.
- We added count of host id on Size, Label, Colors.
- We added host name on Label and filter top 10 by count.

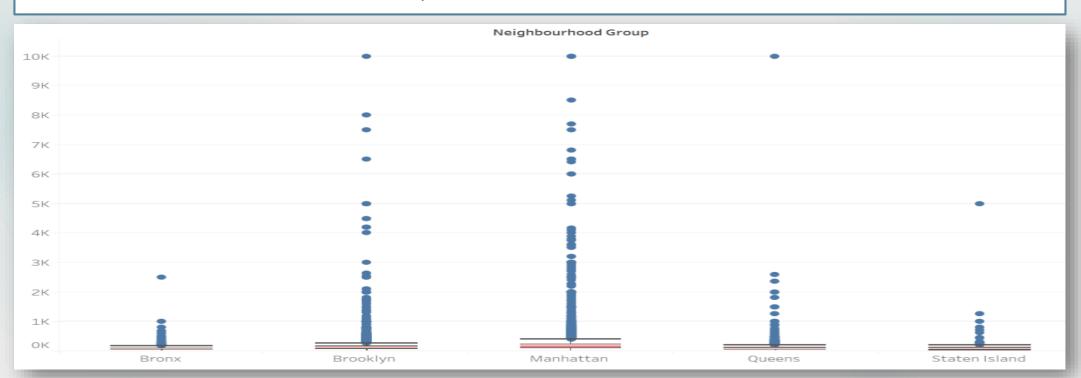

2. Average price of Neighborhood groups.

- The average price of listed properties in Manhattan is around 196.9, which is highest among all neighborhoods.
- Average price for Brooklyn is second highest i.e. 124.4.
- Bronx appears to be an affordable neighborhood as the average price is almost half than Manhattan's average price

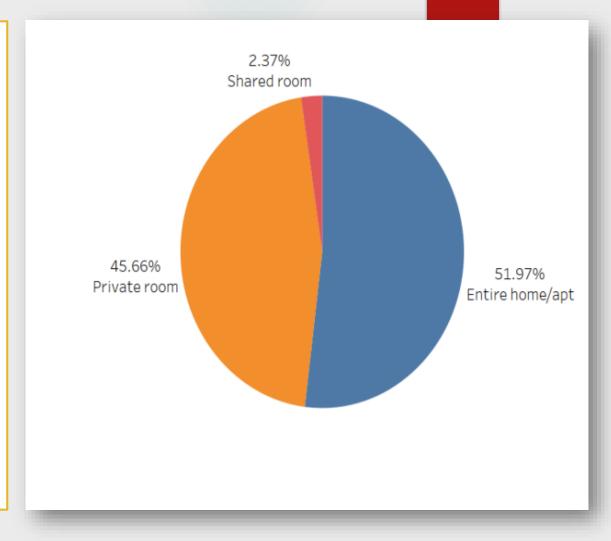

3. Price Analysis Neighborhood wise.

- Most of the outliers in Price column are for Brooklyn and Manhattan.
- Also, Manhattan has the highest range of prices for the listings.
- Bronx is the cheapest of them all.
- We can see the median price of all neighborhood groups lying between \$80 to \$300.
- Price was highly positively skewed so median was very close the lower quartile with some outliers as seen in the boxplot below

4. Room type

- There are three types of rooms Entire home/Apartment, Private room & shared room.
- Overall, customers appear to refer private rooms (45%) or entire homes (52%) in comparison to shared rooms (2.4%).
- Airbnb can concentrate on promoting shared rooms with discounts to increase bookings and also acquire more private listings.

Tools used:

- Data cleaning and preparation: Jupyter notebook Python
- Visualization and analysis: **Tableau**
- Data Storytelling: Microsoft PPT
